Neurons and the brain

Neural Networks

- Origins: Algorithms that try to mimic the brain.
- Was very widely used in 80s and early 90s; popularity diminished in late 90s.
- Recent resurgence: State-of-the-art technique for many applications

If network has s_j units in layer j, s_{j+1} units in layer $j+1$, then $\Theta^{(j)}$ will be of dimension $s_{j+1} \times (s_j + 1)$.

$s_{j+1} \times (s_j + 1)$

+1 comes from addition of bias unit

Andrew Ng

Let's examine how we will represent a hypothesis function using neural networks. At a very simple level, neurons are basically computational units that take inputs (dendrites) as electrical inputs (called "spikes") that are channeled to outputs (axons). In our model, our dendrites are like the input features $x_1 \dots x_n$, and the output is the result of our hypothesis function. In this model our x_0 input node is sometimes called the "bias unit." It is always equal to 1. In neural networks, we use the same logistic function as in classification, yet we sometimes call it a sigmoid (logistic) activation function. In this situation, our "theta" parameters are sometimes called "weights".

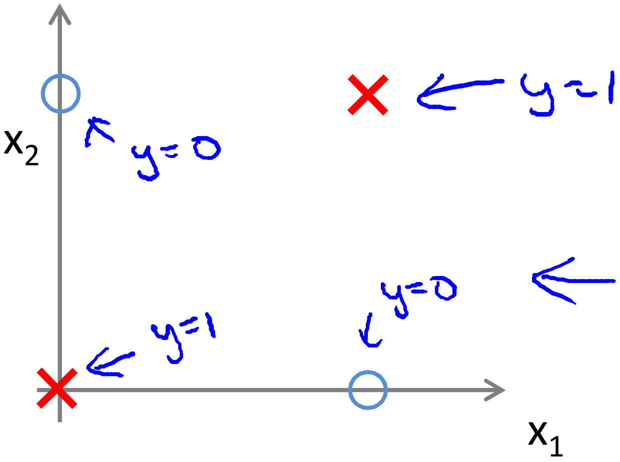
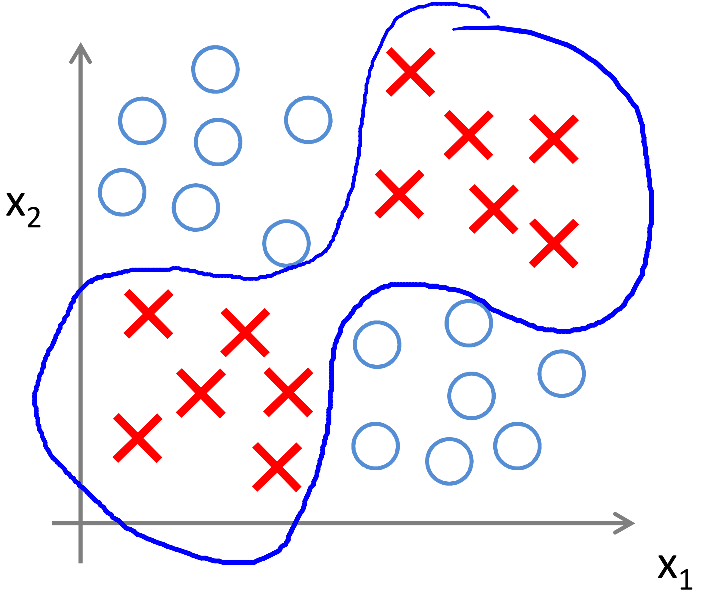
Examples and intuitions I

Non-linear classification example: XOR/XNOR

x_1, x_2 are binary (0 or 1).





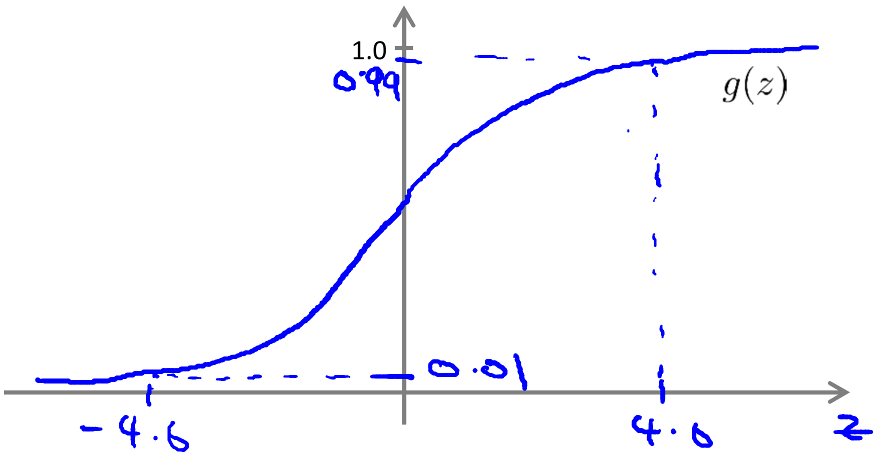
$$y = x_1 \text{ XOR } x_2$$

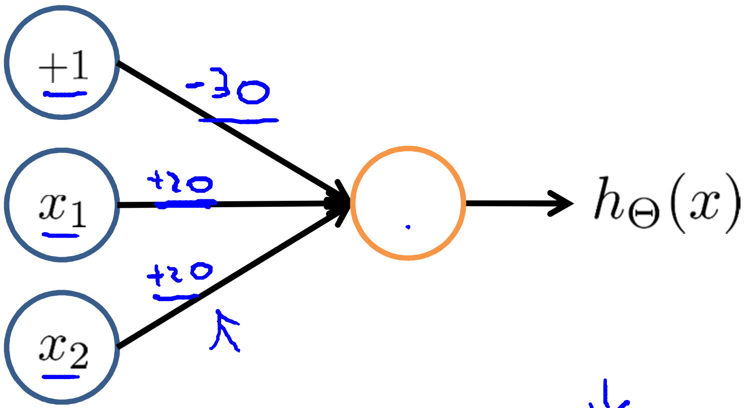
$$x_1 \text{ XNOR } x_2$$

$$\text{NOT } (x_1 \text{ XOR } x_2)$$

Simple example: AND

- $x_1, x_2 \in \{0, 1\}$
- $y = x_1 \text{ AND } x_2$



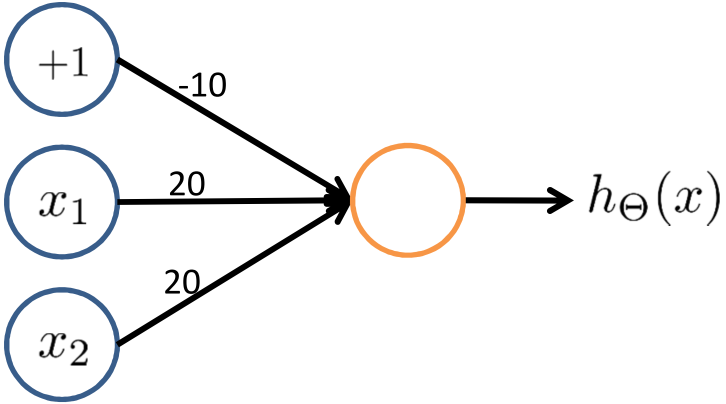


$$h_\Theta(x) = g(\underset{\Theta^{(1)}_{10}}{-30} + \underset{\Theta^{(1)}_{11}}{20}x_1 + \underset{\Theta^{(1)}_{12}}{20}x_2)$$

x_1	x_2	$h_\Theta(x)$
0	0	$g(-30) \approx 0$
0	1	$g(-10) \approx 0$
1	0	$g(-10) \approx 0$
1	1	$g(10) \approx 1$

$h_\Theta(x) \approx x_1 \text{ AND } x_2$

Example: OR function



$$g(-10 + 20x_1 + 20x_2)$$

x_1	x_2	$h_\Theta(x)$
0	0	$g(-10) \approx 0$
0	1	$g(10) \approx 1$
1	0	≈ 1
1	1	≈ 1

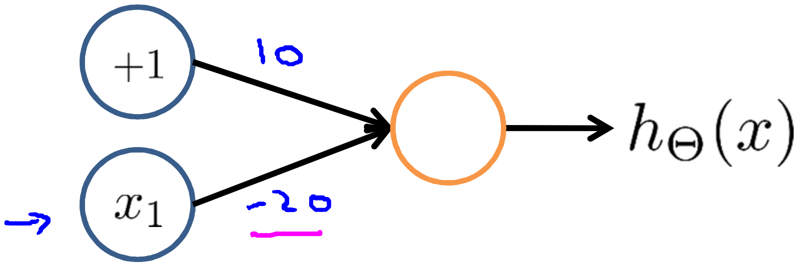
Examples and intuitions II

→ x_1 AND x_2 → x_1 OR x_2 $\{0,1\}$.

Negation:

NOT x_1



x_1	$h_\Theta(x)$
0	$g(10) \approx 1$
1	$g(-10) \approx 0$

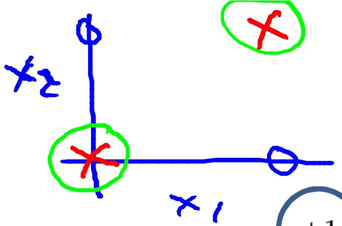
$$h_\Theta(x) = g(10 - 20x_1)$$

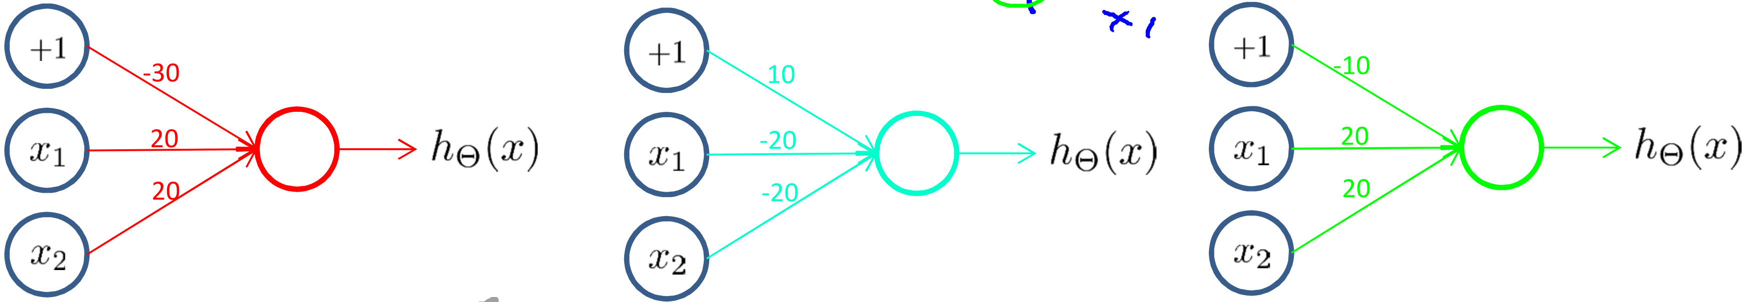
→ (NOT x_1) AND (NOT x_2)

$= 1$ if and only if

→ $x_1 = x_2 = 0$

Putting it together: x_1 XNOR x_2





$\rightarrow$ x_1 AND x_2 $\rightarrow$ (NOT x_1) AND (NOT x_2) $\rightarrow$ x_1 OR x_2
